

IST 263 Project Milestone 7 – Completed Site

Name: Alyssa Tran

Description:

My idea for my website displays the types of piercing placements someone can get on their body. I have around 15 piercings total, which have varied in pain tolerance, and I want to create this site to help people understand their bodies as well as making sure they purchase the right type of jewelry. This site is meant to share my tips on healing the more untraditional piercings and provides information on what I wish someone would've shared with me on my journey.

Paste the urls of the three pages you want me to grade below along with their validation links:

Learn Something New:

The new item I learned for this project was a parallax scroll feature. I remember in one of my other projects for my writing class, I saw the parallax feature on a mock website maker without knowing what it was called, and I wanted to implement it onto my page somehow. I looked at the home page and noticed it was quite boring with the image just sitting as a header. By implementing the parallax scroll with text over it, I give the user a first look at what the site is about. To learn how to use this skill, I went on W3Schools to browse unique features I could learn and ended up finding that parallax was the name of the feature I had seen : https://www.w3schools.com/howto/howto_css_parallax.asp .

Self-Assessment:

I had trouble on step #14 making all pages responsive to an iPhone. The info page had the largest difficulty, and I tried to correct it by altering the spacing, but it still looked incorrect. Since I also worked on this project at home, I had trouble connecting to adobe photoshop on the remote desktop server, which is why I had to alter the images using CSS.

Requirements List:

HTML

1. Correct HTML syntax and the tags chosen are appropriate.

2. Site validates with no errors.
3. Headers and semantic tags used correctly.
4. All links work. Images have alt tags.
5. If applicable: form fields are the correct type for the data.

Images and Layout

6. Layout matches wireframe or is complex layout.
7. Images used in accordance with intellectual property rules.
8. Images are sized down to less than 150k to create best image quality in software like Photoshop.
No giant images being sized with CSS or HTML.
9. Tables used for data display (not layout).

CSS

10. Correct CSS syntax. All CSS is embedded or linked.
11. Page contains adequate white space around all content.
12. Semantic container tags used properly.
13. Flexbox used for layout.
14. Website displays properly on a mobile device.

Accessibility

15. Site passes WAVE checker with no errors or color contrast issues.
16. Lab accessibility checklist followed including skip to content link. Appropriate changes to your site.

The End!
